

IVAN RIADYNSKYI

JUNIOR CLOUD ENGINEER | AWS & TERRAFORM

Woerden, Netherlands | | riadynskyiivan@gmail.com | [LinkedIn](#) | [GitHub](#)

Authorized to work in the Netherlands without employer sponsorship | Available immediately | Open to relocation

PROFESSIONAL SUMMARY

Junior Cloud / DevOps Engineer with hands-on experience designing, deploying and validating AWS infrastructure using Terraform, Linux, Docker, Kubernetes and GitHub Actions. Strong systems and networking foundation from Codam / 42, with practical experience spanning cloud architecture, infrastructure automation, databases, backend development and troubleshooting.

TECHNICAL SKILLS

Cloud & IaC: AWS (VPC, EC2, IAM, S3, RDS, ALB, Auto Scaling, CloudWatch, Systems Manager, Secrets Manager), Terraform (modules, remote S3 state, state locking)

CI/CD & Platform: GitHub Actions, AWS OIDC, Git, Docker, Docker Compose, Kubernetes, K3s, k3d, Argo CD

Systems & Networking: Linux (Ubuntu, Debian, Amazon Linux), Bash, NGINX, TCP/IP, DNS, HTTP/HTTPS, TLS, reverse proxy, load balancing, Security Groups

Programming & Data: C, C++17, Python, SQL, PostgreSQL, Prisma

AI-assisted Engineering: AI agents, agentic coding workflows, LLM-assisted debugging, code review, infrastructure design, technical research

PROJECT EXPERIENCE

Independent - [Highly Available AWS Infrastructure with Terraform](#) | AWS, Terraform, GitHub Actions

- Designed and deployed a 3-tier AWS architecture across 2 Availability Zones and 6 subnets, with an internet-facing ALB, private EC2 Auto Scaling, and isolated Amazon RDS PostgreSQL.
- Implemented IAM roles, Systems Manager instead of SSH, tiered Security Groups, Secrets Manager, IMDSv2, versioned remote S3 state with locking, CloudWatch monitoring, and GitHub Actions authentication through AWS OIDC.
- Validated high availability through 4 failure and scaling scenarios covering EC2 termination, application failure, Auto Scaling recovery, and RDS Multi-AZ failover.

[ft transcendence](#) | Database Engineer & Developer | 5-person team | 125/125

- Owned the PostgreSQL/Prisma persistence layer, designing the relational schema, all 8 database migrations, seed tooling, ORM smoke tests, and game-history persistence.
- Built backend-to-database services and REST API functionality, contributed real-time lobby features for 2-5 player games, and implemented reconnect logic plus one-active-game-per-user enforcement.
- Worked through pull requests, peer review, testing and team documentation; completed the project with the maximum evaluation score of 125/125.

ADDITIONAL ENGINEERING PROJECTS

Kubernetes / GitOps - [Inception of Things](#): multi-node K3s, Kubernetes Deployments/Services/Ingress, Traefik, k3d and Argo CD with automated sync.

Containerized Infrastructure - [Inception](#): Docker Compose stack with NGINX/TLS, WordPress/PHP-FPM, MariaDB, Redis, secrets, health checks and persistent storage.

Systems / Networking - [Webserv](#): C++17 HTTP server; contributed architecture, socket layer, event loop, configuration parsing and core server structures.

CI/CD - [GitHub Actions CI/CD Demo](#): reusable workflows, matrix builds, caching, artifacts, service containers and concurrency controls.

EDUCATION

Codam Coding College - 42 Network | Amsterdam, Netherlands | Oct 2024 - Present

Core Software Engineering Curriculum - all engineering project requirements completed; professional experience requirement remaining.

ADDITIONAL

Learning velocity: 2+ years of continuous self-directed engineering learning; reached system-level C proficiency in 6 months, became productive in C++ within 1 month, and reached confident daily Linux/Bash usage within 3 months.

Languages: English B2-C1 | Ukrainian C2 | Russian C2
